# Straumann® SLActive

The next generation in implant technology

## A3 Dental / DentistAbroad

is proud to be first in Hungary to introduce the revolutionary new Straumann SLActive implant system.

**Only 3-4 weeks healing period!\***

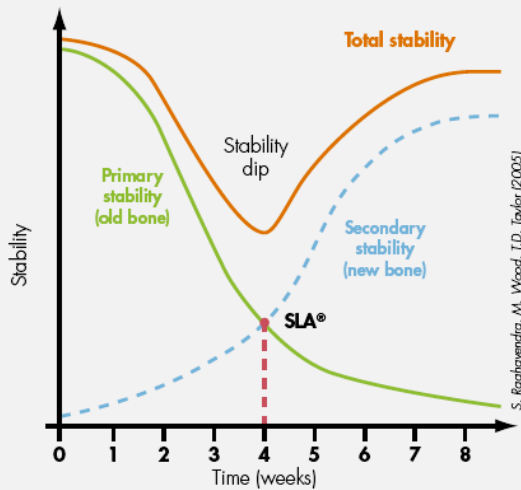

100% success rate so far. Over 500 placed since introduction in July 2006

\* subject to health and bone conditions

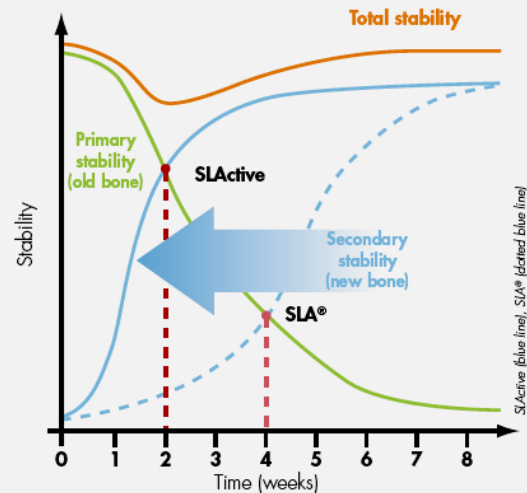

### Conventional surfaces – Stability dip

The speed of osseointegration determines the stability of an implant after placement.

### SLActive eliminates the dip!

SLActive provides more predictability in all treatment protocols by achieving secondary stability sooner than SLA®.

### Background on stability

The total stability is the sum of the primary stability (mechanical stability) and the secondary stability (biologic stability after bone remodelling).

### Higher security and predictability

The bone formation process is initiated at an earlier stage, resulting in significantly improved implant stability during the critical healing period.

SLActive, the first chemically active implant surface with hydrophilic properties, significantly accelerates the osseointegration process and delivers everything you and your patient want in implant treatment:

- **Faster osseointegration** and **higher security** for every indication
- **Reduced healing times** from 6–8 weeks down to 3–4 weeks
- **Increased treatment predictability** in critical protocols

## Introducing Alpha Bio implants in the UK

Designing a successful implant system requires a great deal of knowledge about biology and mechanics, but also the awareness of how the two interact. In the development of Alpha-Bio Tec's implant series we acknowledge the value of Harmony.

Our slogan "In Harmony with Nature" emphasizes the essence of Alpha-Bio Tec's implant system. Our main goal is to gain the ultimate integration between the human body and Alpha-Bio Tec's implants. With the **NanoTec™** implant surface, we have taken it to the next level by helping our implants integrate naturally with the human body. In Alpha-Bio Tec we believe that initial bone healing and long-term marginal bone stability are affected by the implant's design and surface properties. Successful clinical results, in both short and long-term perspective, are related to the features of an implant.

Alpha-Bio Tec's **implant system** is designed to provide the ultimate substitute for natural teeth, with the right conditions. All of the system's parts work together for reliable clinical success. The system offers a wide range of products, including implants and **prosthetic** parts, designed in one platform that fits all implant diameters.

The unique and simple system makes the dentist's work extremely convenient and accomplishes several major advantages:

- Wide range of products with proven clinical biocompatibility.
- Fast and easy insertion.
- High primary stability.
- High predictability.
- High success rates, in immediate loading.

### **NanoTec™** Implant Surface

The implant surface is key in achieving optimal Osseo integration. It is well documented that the surface characteristics of implanted materials can influence the healing and growth of tissues adjacent to the implant surface.

After more than 5 years of intensive research Alpha-Bio Tec has developed a superior **NanoTec™** surface for its implants. Alpha-Bio Tec's **NanoTec™** implant surface is a sandblast large particles acid etched surface. The **NanoTec™** implant surface enables the absorption of blood directly into its micro pores immediately after the implant placement. The **NanoTec™** implant surface promotes healing and growth of tissues adjacent to the implant surface, thus accelerating and improving the Osseo integration process.

Alpha Bio Tec's **NanoTec™** implant surface is treated with sand blasting to create a macro surface of 20-40 micron. Afterwards it undergoes a double thermal acid etching process to create micro pitting between 1 to 5 micron with nano-pitting. The implant surface then undergoes a treatment to build a titanium oxide layer.

Retrospective clinical data shows that Alpha-Bio Tec's implants achieve an overall clinical success rate of 98.3% and a 99.6% clinical success rate when using the immediate loading procedure.

#### **NanoTec™** advantages:

- Increased early bone to implant contact
- Increased stability
- Shortened healing period
- Higher predictability

# Which type of Crown?

Nowadays we have a wide range of possibilities to utilize when it comes to restore a tooth with aesthetic looking crown. In dentistry we talk about two main type of porcelain restorations namely *PFM crowns* (porcelain fused to metal) and full porcelain crowns.

## PFM - Porcelain Fused to Metal

Porcelain-fused-to-metal crowns provide for a strong, durable, and aesthetic treatment option. One of the key factors for the aesthetic and functional success of this type of crown is ensuring the preparation of the underlying tooth structure provides adequate space for the appropriate thickness of the material selected. Additionally, the artistic skill of the laboratory technologist creating the crown will determine its aesthetic appeal.

One consideration in the porcelain-fused-to-metal crown is that these crowns may tend to show the underlying metal or gold margin at the gum line as gums recede over time. Many patients opt for this type of crown, but replace the crown at a later date in order to maintain a higher aesthetic benefit. Porcelain-fused-to-metal crowns with an all porcelain collar can eliminate this vulnerability.

Patient with PFM Crowns – Strong Solution

## Full Porcelain Crowns

The predominant material choice for all-ceramic crowns today is either zirconium, or aluminous materials. They provide a metal-free aesthetic option with a number of benefits.

They can be created with a reduced thickness of material. The elimination of the metal core allows for light transmission through the porcelain for better optical, life-like properties and a higher level of aesthetics.

All-ceramic materials continue to evolve in strength and durability, but **caution should still be exercised** for areas of the mouth requiring heavy function. Continuing research is exploring the significant vulnerabilities of the porcelain systems in such areas.

Same patient with Zirconium Crowns - High Aesthetic

## Zirconium Crowns

As an aesthetic and reliably strong material zirconium oxides are offering a good alternative to replace the posterior PFM bridges (porcelain fused to metal) This material is not only heat and shock resistant but at the same time it doesn't transmit heat and electricity so the sensitivity that you find due to electrolysis at metallic crown and bridges with other metallic elements such as amalgam fillings or clasps of partial dentures you don't have with zirconium oxides. It's a light material and has a good transmission of light.

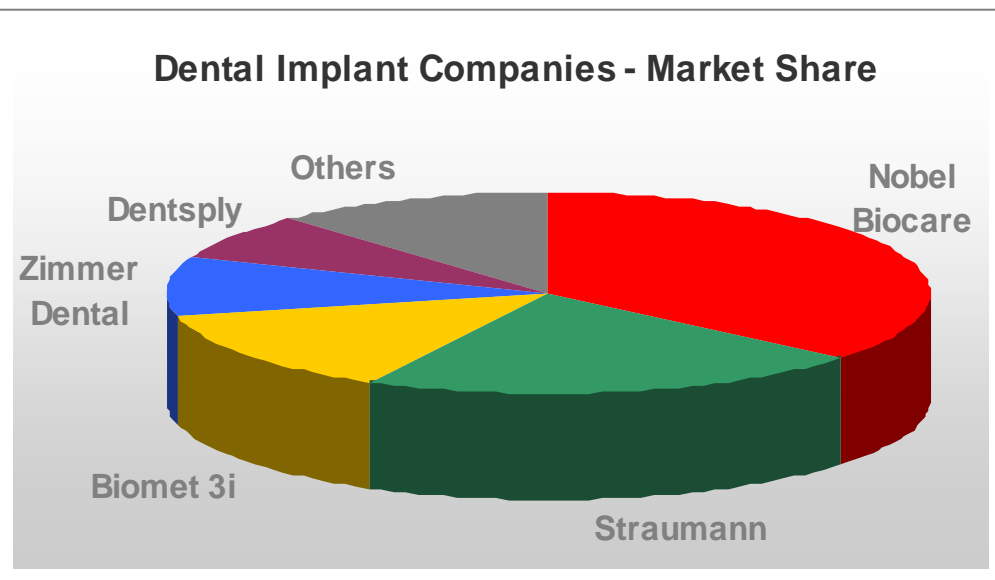

With these crown and bridges you do not have cold and hot sensitivity. You have a material which is not opaque. You have a non allergic material. You have a very compatible material with gingiva. You have a material with less plaque accumulation index meaning that you are going to have a better oral hygiene, that makes it the material of choice not only in the posterior (back molars) but also in the anterior region (front teeth area) as well.

# Which Dental Implant System?

It's a common **misbelieve** that there is a big difference between mayor dental implant manufacturers' products.

All dental implants are made of **Titanium**. All have some kind of special micro surface referred to on various names to ensure better **bone integration**. They all have been tested for years in 1000's of cases before they were made widely available. They all have a **very good success rate** (above 96-97%) if inserted by an experienced professional. They are all **designed to last a lifetime** if taken good care of and will fail, just like your own teeth would if you do not look after them.

There are **small differences** concerning mainly the prosthetic phase. Some implant systems are more suitable to provide solutions in **complex and difficult cases** others are better used in simple cases. There is also difference in the guarantee and **support** a company provides with their implants. And there is a big difference in the price. Mayor implant companies may spend up to 30-40% of their yearly budget on marketing and a lot on research and development. This is reflected in the price you pay at the end of your treatment.
